

Risk Type	Risk	Solution
People	In many group scenarios there is always risk in people pushing their tasks off til the last minute, this causes team members to fall behind who might be waiting on a certain part of the project to be done	Having small sprints helps to ensure that tasks are completed in a timely manner, allowing for progression of the project to occur.
People	Due to the nature of this project, we are unaware of each other's individual strengths and this may force certain people into assignments they aren't strong on.	Create a clear product backlog and allow each member to choose their assignments based on what they think their particular strengths are.
Process	Working in four day sprints can cause the process to be rushed, this may cause the product to not be fully fleshed out.	Ensure that the project is small enough that it can be completed within the allotted time and allow extra time in case requirements change.
Process	For our quiz we risk portraying inaccurate information, based on the users answers we might recommend them to use Python when they would be better off using Java or another language.	To minimize this risk we should implement enough questions to gather a better understanding of their programming style and provide enough programming languages to cover a wide variety of styles.
Product	There is a lot of competition online of people explaining to others which programming language they should use, this product may be overlooked in favor of something else	Make our product as accurate and user friendly as possible, the easier it is for users to determine their ideal language, the more likely they will be to use our product.
Product	Our product has a risk of becoming obsolete/not being important. For many fields in computer science there seems to be a standard or preferred language for the task at hand, therefore, users will be forced into a language anyways.	To combat this we will provide the language the user would best fit as well as the categories it falls under, so people starting out or creating their own project can get a better understanding for what type of programming they will be interested in.
